

TABLET COMPUTERS

Specialised for use in healthcare

Free up your clinical staff to improve patient care with tablet-based workflow automation

Enhance automation and free up staff time

Our 8 and 10-inch tablets provide an efficient means of data capture which increases your productivity and operating efficiency by removing the need for paper trails and reducing the likelihood of transcription errors. Captec tablets are extremely cost-effective when compared to highly specialised medical tablets, yet still comparable to consumer equivalents.

Featuring an ergonomic design for workflow automation, our tablets free hospital staff from administration tasks and allow them to focus more time on delivering exceptional patient care. With an integrated handle for ease of carrying, the risk of drops is reduced. The addition of an integrated kickstand instantly transforms the tablet into an ergonomic, desktop mobile workstation.

Incorporating dual battery banks, Captec tablets operate up to 14 hours between charges depending on model, and can be efficiently charged in our cable-less, multi-bay stations. They are also fully compatible with existing hospital IT infrastructure.

Key features:

- ▶ Automate workflow to increase productivity, reduce transcription errors and improve efficiency
- ▶ Free up clinical staff to improve patient care
- ▶ Minimise the risk of disruption to your working shift with extended battery operating time
- ▶ Efficient cable-less group charging with minimised manual intervention
- ▶ Tailored support packages to maximise the life and performance of tablets

Automate self-service with micro-kiosks

We believe that micro-kiosks can assist with a multitude of automated self-service applications, such as patient check-in.

Our concept of incorporating small, tablet-based micro kiosks with associated peripherals, such as barcode scanners, can provide highly cost-effective and automated platforms to reduce operating costs and improve speed of patient flow.

We are keen to engage with hospital IT departments to identify applications where tablet-based micro-kiosks can add value.

Limit the spread of infection through smart sanitisation

Infection is a major risk in hospitals, with sanitisation a substantial contributor in reducing this risk.

We believe smart sanitising solutions, incorporating badge scanners, ID trackers and facial recognition AI technologies can work to measure, monitor and encourage hand washing and modify hospital staff and patient behaviour, ultimately limiting the spread of infection.

For enhanced cost-effectiveness and productivity, smart sanitisers and self-registration micro-kiosks can be combined to ensure all visitors proactively sanitise on arrival, throughout the day and on exit.

Help us, help you
